

**In the Specification:**

On page 20, lines 10-17, please amend as follows:

-- Figure [[4a]] 4 shows a device (19) containing a pivotally-mounted conduit (20) that is connected internally to outlet capillaries of a cartridge contained in the device such that the fragrance emitted from the cartridge can be sensed by the user remote from the device. Figure [[4b]] 5 shows an alternative design variant whereby remote sensing of fragrance material is achieved by a head-set arrangement (21) having a conduit (22) connected to a cartridge contained in a device (23), the conduit being fixed at one end to the head-set such that, in use, the outlet (24) of the conduit is positioned under the nose of a user wearing the head set. --
